The amsgen package

American Mathematical Society Michael Downes

Version 2.0, 1999/11/30

1 Introduction

This is an internal package for storing common functions that are shared by more than one package in the $\mathcal{A}_{M}S$ -LATEX distribution. Some of these might eventually make it into the LATEX kernel.

Standard package info. Using \ProvidesFile rather than \ProvidesPackage because the latter, when input by, e.g, amsbook, results in LaTeX warning: You have requested document class 'amsbook', but the document class provides 'amsgen'.

- 1 \NeedsTeXFormat{LaTeX2e}% LaTeX 2.09 can't be used (nor non-LaTeX)
- 2 [1994/12/01]% LaTeX date must December 1994 or later
- 3 \ProvidesFile{amsgen.sty}[1999/11/30 v2.0]

2 Implementation

Some general macros shared by amsart.dtx, amsmath.dtx, amsfonts.dtx, ...

\@saveprimitive

The amsmath package redefines a number of TeX primitives. In case some preceding package also decided to redefine one of those same primitives, we had better do some checking to make sure that we are able to save the primitive meaning for internal use. This is handled by the \@saveprimitive function. We follow the example of \@@input where the primitive meaning is stored in an internal control sequence with a @@ prefix. Primitive control sequences can be distinguished by the fact that \string and \meaning return the same information.

- 4 \providecommand{\@saveprimitive}[2]{\begingroup\escapechar'\\relax
- $\label{lem:condition} $$ \edf\@tempa{\string#1}\edef\@tempb{\meaning#1}% $$$
- 6 \ifx\@tempa\@tempb \global\let#2#1%
- 7 \else

Check to see if #2 was already given the desired primitive meaning somewhere else.

```
8  \edef\@tempb{\meaning#2}%
9  \ifx\@tempa\@tempb
10  \else
11  \@latex@error{Unable to properly define \string#2; primitive
12  \noexpand#1no longer primitive}\@eha
13  \fi
14  \fi
15  \endgroup}
```

\@xp Shorthands for long command names.

```
\@nx 16 \let\@xp=\expandafter
17 \let\@nx=\noexpand
```

A token register companion for \@empty. Saves a little main mem and probably makes initializations such as \toks@{} run faster too.

18 \newtoks\@emptytoks

\@oparg Use of \@oparg simplifies some constructions where a macro takes an optional argument in square brackets. We can't use \newcommand here because this function might be previously defined by the amsmath package in a loading sequence such as

\usepackage{amsmath,amsthm}

```
19 \def\@oparg#1[#2]{\@ifnextchar[{#1}{#1[#2]}}
```

\@ifempty \@ifnotempty

\@ifnotempty and \@ifempty use category 11 @ characters to test whether the argument is empty or not, since these are highly unlikely to occur in the argument. As with \@oparg, there is a possibility that these commands were defined previously in amsmath.sty.

```
20 \long\def\@ifempty#1{\@xifempty#1@@..\@nil}
```

- 21 \long\def\@xifempty#1#2@#3#4#5\@nil{%
- \ifx#3#4\@xp\@firstoftwo\else\@xp\@secondoftwo\fi}

\@ifnotempty is a shorthand that makes code read better when no action is needed in the empty case. At a cost of double argument-reading—so for oftenexecuted code, avoiding \@ifnotempty might be wise.

23 \long\def\@ifnotempty#1{\@ifempty{#1}{}}

Some abbreviations to conserve token mem.

```
24 \def\FN@{\futurelet\@let@token}
```

25 \def\DN@{\def\next@}

26 \def\RIfM@{\relax\ifmmode}

27 \def\setboxz@h{\setbox\z@\hbox}

28 \def\wdz@{\wd\z@}

 $29 \def\boxz@{\box\z@}$

30 \def\relaxnext@{\let\@let@token\relax}

\new@ifnextchar

This macro is a new version of LATEX's \@ifnextchar, macro that does not skip over spaces.

31 \long\def\new@ifnextchar#1#2#3{%

By including the space after the equals sign, we make it possible for \new@ifnextchar to do look-ahead for any token, including a space!

```
\let\reserved@d= #1%
```

\def\reserved@a{#2}\def\reserved@b{#3}%

\futurelet\@let@token\new@ifnch 34

35 }

36 %

37 \def\new@ifnch{%

\ifx\@let@token\reserved@d \let\reserved@b\reserved@a \fi

\reserved@b 39

40 }

\@ifstar

There will essentially never be a space before the *, so using \@ifnextchar is unnecessarily slow.

```
41 \end{a*{\#1}\operatorname{eserved@a}{\#2}}
```

The hook \every@size was changed to \every@math@size in the December 1994 release of LATEX and its calling procedures changed. If \every@math@size 2. IMPLEMENTATION 3

is undefined it means the user has an older version of LATEX so we had better define it and patch a couple of functions (\glb@settings and \set@fontsize).

```
42 \@ifundefined{every@math@size}{%
```

Reuse the same token register; since it was never used except for the purposes that are affected below, this is OK.

```
43 \let\every@math@size=\every@size
  44 \def\glb@settings{%
                       \expandafter\ifx\csname S@\f@size\endcsname\relax

  84
  85 }{}% end \@ifundefined test
```

\exc The \exc variable provides a small unit of space for use in math-mode constructions, that varies according to the current type size. For example, the \pmb command uses \exc units. Since a macro or mu unit solution for the \dimen\exc won't work without changing a lot of current code in the amsmath package, we set \exc through the \every@math@size hook. The value of \exc is scaled nonlinearly in a range of roughly 0.5pt to 1.5pt, by the function \compute@exc.

```
86 \mbox{ newdimen}\ex0
```

87 \addto@hook\every@math@size{\compute@ex@}

\compute@ex@ computes \ex@ as a nonlinear scaling from 10pt to current font size (\f@size). Using .97 as the multiplier makes $1 \text{ ex}@ \approx .9 \text{pt}$ when the current type size is 8pt and $1 \text{ ex}@ \approx 1.1 \text{pt}$ when the current type size is 12pt.

The formula is essentially

$$1pt \pm (1pt - (.97)^{\lfloor |10-n| \rfloor})$$

where n = current type size, but adjusted to differentiate half-point sizes as well as whole point sizes, and there is a cutoff for extraordinarily large values of \footnote{o}size (> 20pt) so that the value of \extraordinary exceeds 1.5pt.

```
88 \def\compute@ex@{%
```

- 89 \begingroup
- 90 \dimen@-\f@size\p@
- 91 \ifdim\dimen@<-20\p@

Never make \ex@ larger than 1.5pt.

- 92 \global\ex@ 1.5\p@
- 93 \else

Adjust by the reference size and multiply by 2 to allow for half-point sizes.

94 \advance\dimen@10\p@ \multiply\dimen@\tw@

Save information about the current sign of \dimen@.

95 \edef\@tempa{\ifdim\dimen@>\z@ -\fi}%

Get the absolute value of \dimen@.

- 96 \dimen@ \ifdim\dimen@<\z@ -\fi \dimen@
- 97 \advance\dimen@-\@m sp % fudge factor

Here we use \vfuzz merely as a convenient scratch register

98 \vfuzz\p@

Multiply in a loop.

```
\def\do{\ifdim\dimen@>\z@
99
100
         \vfuzz=.97\vfuzz
         \advance\dimen@ -\p@
101
102 %\message{\vfuzz: \the\vfuzz, \dimen@: \the\dimen@}%
103
         \mbox{qxp\do }fi\
104
       \do
       \dimen@\p@ \advance\dimen@-\vfuzz
105
106
       \global\ex@\p@
       \global\advance\ex@ \@tempa\dimen@
107
     \fi
108
     \endgroup
109
110 %\typeout{\string\f@size: \f@size}\showthe\ex@
```

Tests of the \compute@ex@ function yield the following results:

\f@size	\ex@	\f@size	\ex@
10	$1.0 \mathrm{pt}$	9	0.94089 pt
11	1.05911 pt	8.7	0.91266 pt
12	1.11473 pt	8.5	0.91266 pt
14.4	1.23982 pt	8.4	0.88527 pt
17.28	1.36684 pt	8	0.88527 pt
20.74	$1.5 \mathrm{pt}$	7	0.83293 pt
19.5	1.4395 pt	6	0.78369 pt
		5	0.73737 pt
		1	0.57785 pt

5 Index

\@addpunct Use of the \@addpunct function allows ending punctuation in section headings and elsewhere to be intelligently omitted when punctuation is already present. 112 \def\@addpunct#1{\ifnum\spacefactor>\@m \else#1\fi}

\frenchspacing Change \frenchspacing to ensure that \@addpunct will continue to work properly even when 'french' spacing is in effect.

```
113 \def\frenchspacing{\sfcode'\.1006\sfcode'\?1005\sfcode'\!1004\%
    \sfcode'\:1003\sfcode'\;1002\sfcode'\,1001 }
```

Miscellaneous 2.1

```
115 \def\nomath@env{\@amsmath@err{%
116 \string\begin{\@currenvir} allowed only in paragraph mode%
117 }\@ehb% "You've lost some text"
118 }
```

A trade-off between main memory space and hash size; using \Invalid@0 saves 14 bytes of main memory for each use of \Invalid@, at the cost of one control sequence name. \Invalid@ is currently used about five times and \Invalid@@ is used by itself in some other instances, which means that it saves us more memory than \FNO, \RIFMO, and some of the other abbreviations above. 119 \def\Invalid@0{Invalid use of \string}

The usual \endinput to ensure that random garbage at the end of the file doesn't get copied by docstrip. 120 \endinput

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
