The hypdoc package

Heiko Oberdiek <oberdiek@uni-freiburg.de>

2006/06/02 v1.4

Abstract

This package adds hyper features to the package doc that is used in the documentation system of $\LaTeX 2_{\mathcal{E}}$. Bookmarks are added and references are linked as far as possible.

6	Index	13

1 Features

The package adds the following features:

Bookmarks: For supporting bookmarks package hyperref is loaded. Some T_EX code inside section titles can cause problems during bookmark processing; these can be warnings, ugly bookmark titles or even errors. With the help of <page-header> these things, see hyperref's package documentation.

Additional bookmarks: Unnumbered bookmark entries are generated for:

- Table of contents
- List of figures
- List of tables
- Index

Glossary

Option numbered controls, whether these section or chapters should be numbered. The exception is the table of contents if this it would be the first numbered section. Then just a bookmark is added.

Metadata: The loaded package hyperref, enforced by option pdfusetitle, tries to detect \title and \author and sets the corresponding PDF information fields. In case of problems see the previous item about bookmarks. These enries can be overwritten or new ones added by \hypersetup after the packages is loaded, see documentation of package hyperref.

References, links: Because of package \hyperref \ref become links, also \url, footnote referencing are supported.

Index: The main part of this package deals with index links in order to support the kind of index that package doc provides.

Thumbnails: Package thumbpdf is loaded for the case that the PDF file also should contain thumbnails, see the documentation of this package. But thumbnail embedding is not really necessary, because nowadays AcrobatReader is able to generate and view thumbnails on the fly.

2 Usage

The purpose of this packages is to add PDF features to the documentation of LaTeX packages. Thus just load the package in the driver file that generates the documentation:

\usepackage{hypdoc}

Package doc is loaded by hypdoc, thus you also can replace a \usepackage{doc} with this line. At any case, the package must be loaded before macros of package doc such as \CodelineIndex or \PageIndex are used.

If the class ltxdoc is used, you can also use the configuration file for this class to add package hypdoc. Add the following line to the file ltxdoc.cfg (or create a new one):

\AtEndOfClass{\RequirePackage{hypdoc}}

2.1 Options

There is one option numbered. It controls, whether the starred versions of section or chapter inside \tableofcontents, \listoffigures, ... should be replaced by the non-star versions.

2.2 Simple example

Example of a simple driver file foobar.drv of a package foobar. Often the driver file is packed in the file foobar.dtx and can be extracted by docstrip or if an instruction file for docstrip is provided by:

tex foobar.ins

Note that although docstrip doesn't rely on IATEX, sometimes you need to run the .ins file through IATEX. Oddly enough, often the only IATEX feature in use is \NeedsTeXFormat{LaTeX2e} in the first line.

\documentclass{ltxdoc} \usepackage{hypdoc} \RecordChanges \EnableCrossrefs

```
\CodelineIndex
  \begin{document}
  \title{Title for package \texttt{foobar}}
  \author{Author of package \texttt{foobar}}
  \date{...}
  \maketitle
  \tableofcontents
  \DocInput{foobar.dtx}
  \PrintChanges
  \PrintIndex
  \end{document}
Then compile it, for example with pdfLATeX.
  pdflatex foobar.drv
```

```
makeindex -s gind.ist foobar.idx
makeindex -s gglo.ist -o foobar.gls foobar.glo
pdflatex foobar.drv
```

You will need several cycles until the cross references and similar things are correct.

2.3Example source2e.tex

The source code of the base of LATEX is available as a bunch of .dtx files. LATEX provides the file source2e.tex to merge them all together.

Now you can either load package hypdoc in a private copy of this file (please, respect the LPPL) or use the configuration file ltxdoc.cfg. Example that also sets A4 paper size:

```
\PassOptionsToClass{a4paper}{article}
\AtEndOfClass{\RequirePackage{hypdoc}}
```

Then source2e.tex can be compiled by pdfTFX, for example:

```
pdflatex source2e
makeindex -s gind.ist source2e.idx
makeindex -s gglo.ist -o source2e.glo source2e.gls
pdflatex source2e
makeindex -s gind.ist source2e.idx
makeindex -s gglo.ist -o source2e.glo source2e.gls
pdflatex source2e
```

3 Implementation

```
1 (*package)
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{hypdoc}%
    [2006/06/02 \text{ v1.4 Hyper extensions for doc.sty (HO)}]
```

The package identification is done at the top of the .dtx file in order to use only one identification string.

For unique command names this package uses HD@ as prefix

```

4 Installation

CTAN. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/hypdoc.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/hypdoc.pdf Documentation.

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain-T_EX:

```
tex hypdoc.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

Refresh file databases. If your TEX distribution (teTEX, mikTEX, ...) rely on file databases, you must refresh these. For example, teTEX users run texhash or mktexlsr.

4.1 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the .dtx source file. It can be extracted by AcrobatReader 6 or higher. Another option is pdftk, e.g. unpack the file into the current directory:

```
pdftk hypdoc.pdf unpack_files output .
```

¹ftp://ftp.ctan.org/tex-archive/

Unpacking with LATEX. The .dtx chooses its action depending on the format:

plain-T_EX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using LATEX for docstrip (really, docstrip does not need LATEX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{hypdoc.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfIATFX:

```
pdflatex hypdoc.dtx
makeindex -s gind.ist hypdoc.idx
pdflatex hypdoc.dtx
makeindex -s gind.ist hypdoc.idx
pdflatex hypdoc.dtx
```

5 History

[2002/05/10 v1.0]

• First standalone version.

[2006/02/20 v1.1]

- Option numbered added.
- \HD@savedest@init fixed (empty ..hd file triggered first page with fl ligature).
- Bookmarks for \listoffigures and \listoftables.
- Documentation: features and usage added.
- LPPL 1.3.

[2006/04/27 v1.2]

• \HD@target fixed (multicol.dtx).

[2006/06/01 v1.3]

• Support for package amsdtx's \autoindex added.

[2006/06/02 v1.4]

Bookmark fixed if there are several table of contents, bibliographies, glossaries, . . .

6 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
