Fontname

K. Berry

Table of Contents

1 Introduction

This is Fontname, a naming scheme for (the base part of) external TeX font filenames. This makes at most eight-character names from (almost) arbitrarily complex font names, thus helping portability of TeX documents. We point out some shortcomings of the scheme, and ways of dealing with them.

Please send additions, corrections, or other comments to `tex-fonts@tug.org`. Email `tex-fonts-request@tug.org` to join the list.

Besides this document, the Fontname distribution includes various encoding files, mapping files, and utilities. See the file 'README' for details. You can retrieve the most up-to-date version of these lists from `http://tug.org/fontname`. It is also mirrored on all CTAN hosts in the directory 'tex-archive/doc/fontname'. For a list of CTAN mirrors, see `http://www.ctan.org/tex-archive/CTAN.sites`.

This document is in the public domain and may be used freely.

1.1 History

The original inspiration for Fontname was Frank Mittelbach and Rainer Schoepf's article in *TUGboat* 11(2) (June 1990), which led to my article in *TUGboat* 11(4) (November 1990), pages 512–519. Mittelbach wrote another article criticizing the scheme below in *TUGboat* 13(1) (April 1992), pages 51–53; most of his points are well-taken, but I saw no alternative then, and see no alternative now. Others of his points are addressed in the appropriate sections below.

In August 1995, Fontname version 2 was released, concomitantly with a new release of the PostScript fonts for use with LaTeX and Dvips. After several years of experience, several modifications of the original distribution seemed desirable: more precise specification of encodings (see Section 2.4 [Variants], page 19); machine-readable mapping files (the '*.map' files in the distribution) and standardizing directory names as well as font filenames (included in 'supplier.map' and 'typeface.map').

In Fontname version 1, some encoding variant characters ('0', '2', etc.) have been reassigned to a '7' or '8' sequence (see Section 2.4 [Variants], page 19). Although this is an incompatible change, the advantages of (1) consistency in naming encoding variants, and (2) having some free variants makes it worthwhile. Also, not so coincidentally, new metrics for PostScript fonts in the Cork encoding were issued—same encoding, different metrics. So a new name served a practical purpose as well.

Many people have contributed to this work. In particular, I gratefully acknowledge Nelson Beebe, Barbara Beeton, Rocky Bernstein, Thierry Bouche, Damian Cugley, Berthold K.P. Horn, Alan Jeffrey, Russell Lang, Pierre MacKay, Sebastian Rahtz, Jean Rivlin, and Tom Rokicki.

1.2 References

Related files and distributions:

- The TeX Directory Structure (TDS) standard, available at (`ftp://tug.org/tex/tds` and '*CTAN:*/tds') specifies a directory tree for all TeX library files. The directory names given in Section 2.1 [Suppliers], page 3 and Section 2.2 [Typefaces], page 4 are intended to mesh with that standard.

- The 'modes.mf' file (ftp://tug.org/tex/modes.mf) contains recommended mode names to use as directory names.

- The PSfonts distribution ('*CTAN:*/fonts/psfonts') contains TeX support for many fonts, both commercially available and free.

- The Fontinst distribution ('*CTAN:*/fonts/utilities/psfonts') supports quite general creation of virtual fonts, named according to the scheme given here.

- The Dvips translator (original at ftp://labrea.stanford.edu/pub/dvips*.tar.gz and variation at ftp://tug.org/tex/dvipsk.tar.gz) supports resident and downloadable PostScript fonts. Dvips was the first real application of Fontname 1. Dvips also includes Afm2tfm, another program that can create virtual fonts.

- The Dviljk processor (ftp://tug.org/tex/dviljk.tar.gz) contains TeX support for the fonts built into the LaserJet 4.

- 'Designing New Typefaces with Metafont', by Richard Southall, Stanford Computer Science Department Technical Report STAN-CS-85-1074, September 1985, for a comprehensive terminology of font design.

2 Filenames for fonts

We must limit ourselves to eight character names, for compatibility with DOS filesystems and the ISO 9660 standard used for CD-ROM distribution. Names may consist of only the letters (monocase a-z), numerals (0-9), and underscore.

Here is the basic division of the eight characters (the spaces here are merely for readability):

```
S TT W [V...] [N] [E] [DD]
```

where

S	represents the supplier of the font.
TT	represents the typeface name.
W	represents the weight.
V...	represents the variant(s), and is omitted if both it and the width are normal. Many fonts have more than one variant.
N	represents the encoding, and is omitted if the encoding is nonstandard. Encodings are subsumed in the section on variants (see Section 2.4 [Variants], page 19).
E	represents the width ("expansion"), and is omitted if it is normal.
DD	represents the design size (in decimal), and is omitted if the font is linearly scaled. Mittelbach in *TUGboat* 13(1) proposes using hexadecimal or base-36 notation. I don't think the increased range makes up for the unreadability of the common sizes (e.g., 10 pt fonts would have a suffix 'a' (in hex), or 'j' (in base 36)).

The weight, variants, and width are probably all best taken from the original name of the font, instead of trying to relate them to some external standard.

2.1 Suppliers

The *supplier* is the source of a font, typically a (digital) type foundry.

You should use the supplier letter which matches the supplier you obtained the font from, not the original source; for example, Avant Garde was designed by Herb Lubalin for ITC, but Adobe also sells it. The name of the font that you get from Adobe should start with 'p'. This is because font resellers typically make modifications to the original design.

Notes on specific suppliers:

'f'	For fonts that are distributed without any specific attribution to the creator, by individuals, or by small foundries. (Unfortunately, we don't have enough characters to assign one to every font supplier in the world.)
'r'	obsolete; specifies raw fonts, in the old distribution of Dvips. New fonts should never use 'r'. (The right thing to do is specify the correct encoding, variant, or whatever the font's characteristics actually are.)
'z'	for fonts that just don't fit well into the naming scheme. The 'z' should be followed by the real supplier letter.

Here is the table from the file '`supplier.map`'. It is organized alphabetically by abbreviation. Each line consists of an abbreviation, directory name, and comment.

2.2 Typefaces

For our purposes, a *typeface* is a collection of related fonts.

We sometimes use the same typeface abbreviation for fonts with different supplier names, where we know (usually by inspection) that the fonts truly are the same. This helps conserve abbreviations.

Notes on specific typefaces:

'ad'
'gm'   To explain a common confusion: '`ad`' is Adobe Garamond (with a '`FontName`' of '`AGaramond`'). This is quite different from the '`Garamond`' typeface distributed by Adobe, which is actually ITC Garamond. (Garamond No. 3 ('`f3`'), Simoncini

Garamond ('`ig`'), and Stempel Garamond ('`eg`') are still other variations on the Garamond theme.)

'`lh`'

'`ls`'

'`lx`'

'`r1`'   These abbreviations for Lucida typeface subfamilies, et al., solve a problem with names getting too long, or help conserve variant abbreviations. See Section 2.4 [Variants], page 19. Ideally, they would not exist.

'`ns`'

'`nt`'

'`tm`'   Suppliers offer as many variations on the Times New Roman design as they do Garamond. Adobe has '`Times`', '`TimesNewRoman`', and '`TimesNewRomanPS`'. Although this last has been used by other foundries (e.g., Monotype) for a Times variation exactly compatible with Adobe's '`Times`', Adobe itself also offers it, so we must have abbreviations for all three.

'`pi`'   For pi fonts. Since names of pi fonts are rather arbitrary, it is not useful to try to assign typeface abbreviations to all of them. Instead, we use the supplier letter, '`pi`', an arbitarily-assigned three-digit number, a weight and (if necessary) a variant. For example, '`mpi001r`'. Pi font '`001`' for one supplier has nothing to do with pi font '`001`' for another.

Here is the table, from the file '`typeface.map`'. It is organized alphabetically by abbreviation. Each line consists of an abbreviation and directory name, possibly followed by PostScript '`FontName`'s and/or a comment in roman. The '`FontName`' may be preceded by a letter *s* and a '`:`', as in '`b:Dutch`'. In that case, the *s* is a supplier abbreviation, and we've used that abbreviation for the given '`FontName`' from that supplier.

2.3 Weights

The *weight* of a font specifies its boldness. Arranged from lightest to heaviest (more or less):

> hairline, extra light, light
> book, regular, medium
> demibold, semibold, bold, extra bold, heavy
> black, ultra, poster

Here is the table, from the file '`weight.map`'. It is organized alphabetically by abbreviation. Each line consists of an abbreviation and any parts of a PostScript '`FontName`' which use that abbreviation.

```
a Thin Hairline
b Bold
c Black
d Demi
h Heavy Heavyface
j ExtraLight
k Book
l Light
m Medium
p Poster
r Regular Roman
s Semibold
u Ultra UltraBlack
x ExtraBold ExtraBlack
```

2.4 Variants

Variants include typeface variations (e.g., italic, sans serif), and font encodings (e.g., Adobe standard, TEX text).

A fontname may require multiple variants. To resolve the worst ambiguities, we specify that any encoding variant ('7', '8', or '9', see below) come last and any other numeral variant come first (to avoid confusion with a design size). We recommend but do not require that the other variants be given in alphabetical order. (It's not required because it's too painful to implement the sorting in TEX, and many existing names already have non-alphabetized variants.)

The letterspacing possibilities introduced by `fontinst` and virtual fonts have not yet become sufficiently widespread to make standardization beneficial. Likewise for the many possible ways to generate small caps fonts.

Notes on specific variants, both old and new:

'1'
'4'
'6'
'b'   These variants ('semisans', 'bright', 'semiserif', and 'fax') were used only for single typefaces, so to conserve variant abbreviations, they now have typeface

abbreviations instead. Also, for '`b`', to avoid too-long names; and for the others, to avoid variant vs. design-size ambiguities.

'`g`'
'`h`'   Since these variants were not actually used in any font names, they are now obsolete and may be reassigned in the future.

'`5`'
'`6`'
'`7`'
'`8`'
'`9`'   These characters begin a two-character *encoding variant*. Generally, '`7`' is for 7-bit encodings, '`8`' is for 8-bit encodings, and '`9`' is for expertised encodings with or without oldstyle digits (see the '`x`' item below), but this is not an absolute rule. Also, '`5`' is presently used for phonetic encodings and '`6`' for Cyrillic encodings. The '`9s`' ('`SuperFont`') variant contain all of Adobe, Latin 1, and Expert glyphs, perhaps with slightly different metrics than the original fonts.

For a font to be named with a certain encoding variant, it's not necessary that all the characters appear in precisely the same positions as in the encoding definition. It's enough that the usual TeX macros work. In practice, this means that it's ok for a font to be labelled '`7t`' if the only difference from Computer Modern is that the ligatures and the '`lslash`' and '`Lslash`' characters are different, since it's impossible to access or change the ligature table from TeX. Standard PostScript fonts don't have an '`lslash`' character the way Computer Modern does, but they do have the '`Lslash`' and '`lslash`' characters themselves, so the usual TeX `\lslash` and `\Lslash` macros can be made to work via ligatures. See the file '`T1.etx`' file in the `fontinst` distribution for details.

If a name does not contain a specific encoding variant, its encoding is unspecified. For example, some of the fonts distributed with Dvips(k) have names like '`ptmr`' for '`Times-Roman`'; they use the Dvips encoding (see Section B.5 [dvips], page 257), which is close to (but not the same as) the TeX text encoding (as in Computer Modern Roman). Similarly, the TFM files distributed with Dvilj(k) for the builtin LaserJet 4 fonts have names like '`cunm`', since these fonts, while compatible with TeX text, contain many additional characters.

'`9`'   These items are needed only because '`x`' (and possibly '`j`') followed by a two-character regular variant makes some names too long. That is, '`9t`' is equivalent in meaning to '`x7t`', and '`9d`' is equivalent to '`jx7t`'. (This may not be true for all '`9x`' encodings, though.)

'`k`'
'`z`'   These variants (indicating Greek and Cyrillic fonts, respectively) are obsolete; future fonts in different scripts should be assigned an appropriate encoding abbreviation. These are not currently standardized, due to ignorance of the appropriate encodings. Please send suggestions for abbreviations to the address in Chapter 1 [Introduction], page 1.

'm'
'v'
'y' These math-related variants remain for the sake of typeface-specific math en-
     codings, e.g., Lucida. Fonts that use the Computer Modern math encodings
     should use '7m' (see Section B.11 [texmital], page 293), '7v' (see Section B.9
     [texmext], page 284), and '7y' (see Section B.10 [texmsym], page 288).

'n' This is used for several different (but very rare) variants: only the Stone typeface
     has an "informal" variant, and only a few Monotype fonts have a "schoolbook"
     variant, with different 'a', 'g', and 'y' shapes.

'r' Included only if no other variants, including encodings, apply, and either the
     width (see Section 2.5 [Widths], page 23) is not 'r' or a design size is present.
     I.e., 'r' is only used as a placeholder. When the normal version of the typeface
     is sans serif (e.g., Helvetica), 'r' should be used when necessary, not 's'. Use
     's' only when the typeface family has both serif and sans serif variants.

's'
't' Mittelbach in *TUGboat* 13(1) suggests that these variants (for 'sans' and 'type-
     writer') should be identified as part of the typeface name, because there are few
     typeface families with these variants. I feel that since they are logically variants,
     it's best to name them that way. But 'LucidaSans' (see Section 2.2 [Typefaces],
     page 4) and a few others are exceptions, to avoid too-long names.

'x'
'8x'
'9?' '8x' indicates a font in the 'Expert' encoding itself. 'x' indicates an *expertised*
     font, i.e., a composite (virtual) font that includes characters from an '8x' font.
     And in fact an 'xee' sequence is replaced by '9e', to save characters.

Fontname 1 assignments are shown in brackets in the following table, from the file
'variant.map'. It is organized alphabetically by abbreviation. Each line consists of an
abbreviation and either any parts of a PostScript 'FontName' which use that abbreviation
or the PostScript 'Encoding' name.

```
    0 inferior
    1 superior
    2                                        proportional digits, not tabular

2.5 Widths

The *width* of a font specifies the compression or expansion of the font. Arranged from narrowest to widest (more or less):

> ultra compressed, extra condensed, compressed, condensed, narrow
> regular
> semiextended, extended, expanded, wide

Expansion or compression of fonts is sometimes done automatically (as by the PostScript `scale` operator), and sometimes done by humans. In the latter case, the human will also presumably choose a font name which includes 'Extended' or 'Expanded' or 'Condensed' or 'Narrow' or whatever according to their own preferences; the abbreviation can follow

along. When creating a new synthetically expanded or compressed font for use with TeX, e.g., with Afm2tfm or `fontinst`, use 'n' and 'e'.

Here is the table, from the file '`width.map`'. It is organized alphabetically by abbreviation. Each line consists of an abbreviation and any parts of a PostScript '`FontName`' which use that abbreviation.

```
c Condensed Cond
e Expanded
n Narrow Semicondensed
o UltraCondensed
p Compressed Compact
q ExtraCompressed ExtraCondensed
r Normal Medium Regular (usually omitted)
t Thin
u UltraCompressed
v ExtraExpanded more than Expanded, less than Wide
w Wide
x Extended Elongated
y Semiexpanded
```

3 Long names

Eight characters is not enough to unambiguously represent all fonts. To do that, we have to allow ourselves arbitrarily long names. Although we certainly cannot use such names for the files themselves, we could still use them in TeX documents given a simple mapping file, as discussed below.

3.1 A fontname mapping file

At the moment, most implementations of TeX look up a TFM file (as part of the `\font` command), by searching for a file with the name given by the user (possibly in any of series of directories). But if we also looked TFM names up in *another* file (or set of files), which specifies the actual filename, the fontname given in the TeX source file could be almost anything at all, of any length.

In version 5.851d of Web2c, I implemented this mapping file. Each file '`texfonts.map`' in a search path is read for abbreviations. The file has a straightforward format: each line specifies the filename and the TeX name for one font, separated by whitespace. Extra information on the line is ignored; then more information could be specified for the benefit of DVI-reading programs in the same file. Comments start with `%` and continue to the end of the line.

Besides allowing long names, this sort of mapping file has other benefits. TeX source or DVI files can be more easily transported, because the font names in a particular file can be made work on every system. Also, when combined with a consistent naming scheme, macros could be written to access any of a number of fonts. Right now, each font family has to have specialized macros written to deal with it.

Incidentally, Professor Knuth has approved this as a legitimate "system-dependent" extension; a TeX with such a feature can still be called "TeX".

3.2 A naming scheme for long names

Once we allow ourselves long names, we can construct a naming scheme to handle arbitrary fonts without much difficulty. Here is one proposal, based on the X Window System font naming conventions.

        `supplier-family-weight-variants-width-encoding--size`

supplier is the usual `Adobe`, `Autologic`, etc., as well as `unknown` or `bizarre`—this last meaning the rest of the name is nonstandard. If the *supplier* is missing, i.e., the name starts with a `-`, "public domain" is assumed. For fonts made by individuals, the initials of the designer would probably make a good *supplier*.

family is `ComputerModern` or `Times` or whatever.

Everything else is optional. The `--` before the *size* lets one specify a name with, say, a weight and variants, but then skip the *width* and *encoding*, but still be able to give a size.

weight and *width* are as described earlier.

If there is more than one variant, they are separated with some character other than '`-`', say '`=`':

```
B+H-Lucida-Bold-Sans=Typewriter--10
```

encoding is what Metafont calls the `font_coding_scheme`—the layout of the characters in the font. For example, 'Cork' or 'ISOLatin1' or 'AdobeAlternate'.

Names are case-sensitive, for consistency with the rest of TeX and with PostScript, etc. Spaces cannot be used in the name, to make it easier for TeX to parse. Likewise, characters with default category codes other than 11 (letter) or 12 (other) should not be used.

Another possibility is to forget all the above, and simply use the vendor's name (perhaps prefixed by the vendor): 'Times-Roman'.

Appendix A Font name lists

These sections contain a list of fonts from various suppliers together with the corresponding names.

A.1 Standard PostScript fonts

Abbreviated names for the 35 standard PostScript fonts. An encoding variant, such as '`8a`' for the Adobe '`StandardEncoding`', is omitted.

'`pagk`'   '`AvantGarde-Book`'

'`pagko`'   '`AvantGarde-BookOblique`'

'`pagd`'   '`AvantGarde-Demi`'

'`pagdo`'   '`AvantGarde-DemiOblique`'

'`pbkd`'   '`Bookman-Demi`'

'`pbkdi`'   '`Bookman-DemiItalic`'

'`pbkl`'   '`Bookman-Light`'

'`pbkli`'   '`Bookman-LightItalic`'

'`pcrb`'   '`Courier-Bold`'

'`pcrbo`'   '`Courier-BoldOblique`'

'`pcrr`'   '`Courier`'

'`pcrro`'   '`Courier-Oblique`'

'`phvb`'   '`Helvetica-Bold`'

'`phvbo`'   '`Helvetica-BoldOblique`'

'`phvbrn`'   '`Helvetica-NarrowBold`'

'`phvbon`'   '`Helvetica-NarrowBoldOblique`'

'`phvr`'   '`Helvetica`'

'`phvro`'   '`Helvetica-Oblique`'

'`phvrrn`'   '`Helvetica-Narrow`'

'`phvron`'   '`Helvetica-NarrowOblique`'

'`pncb`'   '`NewCenturySchlbk-Bold`'

'`pncbi`'   '`NewCenturySchlbk-BoldItalic`'

'`pncri`'   '`NewCenturySchlbk-Italic`'

'`pncr`'   '`NewCenturySchlbk-Roman`'

'`pplb`'   '`Palatino-Bold`'

'`pplbi`'   '`Palatino-BoldItalic`'

'pplri'   'Palatino-Italic'

'pplr'   'Palatino-Roman'

'psyr'   'Symbol'

'ptmb'   'Times-Bold'

'ptmbi'   'Times-BoldItalic'

'ptmri'   'Times-Italic'

'ptmr'   'Times-Roman'

'pzcmi'   'ZapfChancery-MediumItalic'

'pzdr'   'ZapfDingbats'

A.2 Adobe fonts

The 'adobe.map' file has abbreviations for Adobe fonts.

A.9 URW fonts

Information graciously supplied through URW, via Vincent Ertner: Each URW font has an assigned font number. The last character describes the size or purpose of the font, as the design of the font is optimized accordingly:

X000000E   Extreme: 8 pt and smaller

X000000T   Text: between 8 and 18 pt

X000000D   Display: 18 pt and larger

X000000P   Poster: 48 pt and larger

X000000M   Monospaced / Typewriter

X000000L   LaserWriter / PostScript / Adobe compatible

X000000I   Intellifont PCL (5) compatible

An 'F' identifier is not known.

The 'urw.map' file has abbreviations for URW fonts.

Appendix B Encodings

The following sections define various encodings as PostScript encoding vectors. These files can be installed in the Dvips header directory and then used in 'psfonts.map' to change font encodings of downloadable or builtin fonts (see section "psfonts.map" in *Dvips*).

You can also specify these '.enc' files to Afm2tfm when building a font (see section "Changing font encodings" in *Dvips*).

For a discussion of TeX font encodings in general, and defining new ones for use with fontinst in particular, see http://www.ctan.org/tex-archive/fonts/utilities/fontinst/doc/encspecs

A tutorial on character code issues in general is available at http://www.cs.tut.fi/~jkorpela/chars.html

Naming specific characters is a tangled and difficult area. Here are some links to character tables for Unicode, Adobe, and WGL4, for your researching pleasure (thanks to Boguslaw Jackowski for the list):

- http://www.unicode.org/Public/UNIDATA/UnicodeData.txt
- http://www.unicode.org/Public/UNIDATA/NamesList.txt
- http://partners.adobe.com/asn/tech/type/corporateuse-old.txt
- http://partners.adobe.com/asn/tech/type/aglfn13.txt
- http://partners.adobe.com/asn/tech/type/unicodegn.jsp
- http://www.microsoft.com/OpenType/otspec/WGL4.htm

B.1 '6w.enc': Cyrillic CP-1251

B.3 '8r.enc': TEX base encoding

```
% File 8r.enc  TeX Base 1 Encoding  Revision 2.0  2002-10-30
%
% @@psencodingfile@{
%   author    = "S. Rahtz, P. MacKay, Alan Jeffrey, B. Horn, K. Berry,
%                W. Schmidt, P. Lehman",
%   version   = "2.0",
%   date      = "27nov06",
%   filename  = "8r.enc",
%   email     = "tex-fonts@@tug.org",
%   docstring = "This is the encoding vector for Type1 and TrueType
%                fonts to be used with TeX.  This file is part of the
%                PSNFSS bundle, version 9"
% @}
%
% The idea is to have all the characters normally included in Type 1 fonts
% available for typesetting. This is effectively the characters in Adobe
% Standard encoding, ISO Latin 1, Windows ANSI including the euro symbol,
% MacRoman, and some extra characters from Lucida.
%
% Character code assignments were made as follows:
%
% (1) the Windows ANSI characters are almost all in their Windows ANSI
% positions, because some Windows users cannot easily reencode the
% fonts, and it makes no difference on other systems. The only Windows
% ANSI characters not available are those that make no sense for
% typesetting -- rubout (127 decimal), nobreakspace (160), softhyphen
% (173). quotesingle and grave are moved just because it's such an
% irritation not having them in TeX positions.
%
% (2) Remaining characters are assigned arbitrarily to the lower part
% of the range, avoiding 0, 10 and 13 in case we meet dumb software.
%
% (3) Y&Y Lucida Bright includes some extra text characters; in the
% hopes that other PostScript fonts, perhaps created for public
% consumption, will include them, they are included starting at 0x12.
% These are /dotlessj /ff /ffi /ffl.
%
% (4) hyphen appears twice for compatibility with both ASCII and Windows.
%
% (5) /Euro was assigned to 128, as in Windows ANSI
%
% (6) Missing characters from MacRoman encoding incorporated as follows:
%
```

```
%       PostScript       MacRoman        TeXBase1
%       -------------    -------------   -------------
%       /notequal        173             0x16

B.5 'dvips.enc': Dvips encoding

```
% @psencodingfile{
%   author = "T. Rokicki, K. Berry",
%   version = "2.1",
%   date = "12jun05",
%   filename = "dvips.enc",
%   email = "tex-fonts@tug.org",
%   codetable = "ISO/ASCII",
%   docstring = "An encoding for PostScript fonts to be used with TeX.
%
% This is almost the default encoding produced by the afm2tfm program
% that comes with the dvips distribution, when it is applied to a
% StandardEncoding PostScript font.  The positions of the accented
% characters (which afm2tfm assigned more or less randomly in the
% previous set of fonts) have been held fixed.
%
% It is almost upward-compatible with TeX text.  (The primary exceptions
% are dotaccent and hungarumlaut.)  Some of the ligatures are also in
% different positions, but this is not important, since ligature
% positions are defined in the TFM file, not by macros.
%
% The character positions were assigned in this order:
%   1) non-composite characters in the afm2tfm encoding (except dotlessj
%      was included in its plain TeX position);
%   2) available characters in the Cork (EC) encoding;
%   3) remaining composite characters in the base encoding (starting at
%      position 130 decimal).  We don't include all the other base
%      characters because that changes the height/depth/width tables in
%      the TFM files (because more characters mean more distinct values).
%
% We leave the initial positions open for the Greek letters in Times-Roman.
% "
% }
% 12jun05 - don't use extra @'s for Texinfo any more.

%
% history:
%    version 1.0 (28-Jan-2000):
%      First version.
%
%    version 1.1 (29-Apr-2002):
%      Rewritten to make it AGL compliant.
%
%    version 1.2 (01-May-2002):
%      Use uni2423 instead uni2420.
%
%    version 1.3 (27-Sep-2002):
%      . Changed the following glyph names to Unicode entities:
%          0xB3  uni1EBD  etilde
%          0x93  uni1EBC  Etilde
%      . Ytilde (uni1EF8) was used in slot for ytilde (uni1EF9).
%      . Using .notdef in slot for compound word mark (on position 0x17)
%        caused some problems so it was changed to cwm (for compatibilty
%        with ec.enc).
%      . Use sfthyphen in slot 127 instead of hyphen.
%
%    version 1.4 (20-Apr-2005):
%      Add copyright.
%      Minor documentation updates.

%
% Some notes on the glyph names:
%
% . We follow the Adobe Glyph List (AGL), also using its associated
%   algorithm.
%
% . The glyphs 'spacing dot below' (on position 0x05), 'spacing hook above'
%   (on position 0x0C), and 'compound word mark' (on position 0x17) are not
%   in Unicode.  We call them 'dotbelow', 'hookabove', and 'cwm',
%   respectively.
%
% . The following glyphs have no special name in the AGL (or names which
%   should not be used in general) and are thus represented as a Unicode
%   entity:
%
%     0x1A  uni1EF6  Y hook above
%     0x1B  uni1EF7  y hook above

% ========================================================================
                           QX LAYOUT ver. 0.06
% ========================================================================
Release date: 24 August 2003
Original URL: ftp://bop.eps.gda.pl/pub/qx/
E-mail: JNSteam at gust.org.pl

QX Layout is, actually, a pair of encodings: one for TeX and one for GUI
systems. QX layout has been worked out by the Polish TeX Users Group GUST as
a difficult compromise between needs and abilities. The character set of the
QX layout is expected to suffice for the typesetting of texts (using TeX) in
most of European languages.

QX Encoding for TeX is based on EC (Cork Encoding) with a few characters
exchanged. E.g., gbreve, Gbreve, uring, and Uring, which can be obtained by
superimposing of an accent, are replaced by Lithuanian iogonek, Iogonek,
uogonek, and Uogonek, respectively, which should not be assembled form
separate elements; QX Encoding for GUI systems is a variant of the Code Page
```

1250 (and also includes Lithuanian characters with ogonek).

After a long debate, we decided (in ver. 0.04 of the QX layout) to replace
omnipresent but actually nonexistent [tT]cedilla by Romanian [tT]commaaccent;
censequently, Turkish [sS]cedilla was replaced by [sS]commaaccent (still we
would recommend to keep the glyph of a [sS]cedilla character in a font).

Under the pressure from euro currency funs, we included moreover an
Euro symbol (in ver. 0.05 of the QX layout). We assigned the slot
128 for it complying with Microsoft proposal for non-cyrillic fonts
(http://www.microsoft.com/typography/faq/faq12.htm):

  The symbol has been added to the following codepages at position
  '0x80'; 1250 Eastern European, 1252 Western, 1253 Greek, 1254 Turkish,
  1257 Baltic, 1255 Hebrew, 1256 Arabic, 1258 Vietnamese, 874 Thai.
  In 1251 Cyrillic the symbol will be added at position '0x88'.

Therefore, we had to do something with a Lithuanian Iogonek character that
previously had occupied this slot. We decided to remove Thorn (222, Tcedilla
in CP 1250) and thorn (254, tcedilla in CP 1250) characters from the Windows
QX layout (we recommend, as with [sS]cedilla characters, to keep the glyphs
in a font) and use the freed slots for Iogonek (previously 128) and iogonek
(previously 144, now free), respectively. The TeX QX layout, fortunately, had
had the slot 128 already free, hence there was no need for rearrangement.

Finally, we decided to change the name of a (non-standard) ligature
fk to f_k, complying with Adobe recommendations contained in:
http://partners.adobe.com/asn/developer/typeforum/unicodegn.html

Most recent change (24.08.2003, ver. 0.06) was the extension of
the character set by ligatures ij, IJ (available only in the TeX
encoding) and a punctuation mark threequartersemdash.

Below you'll find the comparison of basic layouts for TeX and GUI systems
with QX ver. 0.06.

B.12 'texnansi.enc'

From Y&Y.

```
% @psencodingfile{
%    author = "Y&Y, Inc.",
%    version = "1.1",
%    date = "1 December 1996",
%    filename = "texnansi.enc",
%    email = "help@YandY.com",
%    address = "45 Walden Street // Concord, MA 01742, USA",
%    codetable = "ISO/ASCII",
%    checksum = "xx",
%    docstring = "Encoding for fonts in Adobe Type 1 format for use with TeX."
% }
%
% The idea is to have all 228 characters normally included in Type 1 text
% fonts (plus a few more) available for typesetting.  This is effectively
% the character set in Adobe Standard Encoding, ISO Latin 1, plus a few more.
%
% Character code assignments were made as follows:
%
% (1) The character layout largely matches 'ASCII' in the 32 -- 126 range,
% except for 'circumflex' in 94 and 'tilde' in 126, to match 'TeX text'
% ('asciicircumflex' and 'asciitilde' appear in 158 and 142 instead).
%
% (2) The character layout matches 'Windows ANSI' in almost all places,
% except for 'quoteright' in 39 and 'quoteleft' in 96 to match ASCII
% ('quotesingle' and 'grave' appear in 129 and 18 instead).
%
% (3) The character layout matches 'TeX typewriter' used by CM text fonts
% in most places (except for discordant positions such as hungarumlaut
% (instead of braceright), dotaccent (instead of underscore) etc.
%
% (4) Remaining characters are assigned arbitrarily to the 'control character'
% range (0 -- 31), avoiding 0, 9, 10 and 13 in case we meet dumb software
% - similarly one should really avoid 127 and 128 if possible.
% In addition, the 8 open slots in Windows ANSI between 128 and 159 are used.
```

```
%
% (5) Y&Y Lucida Bright includes some extra ligatures and such; ff, ffi, ffl,
% and 'dotlessj,' these are included 11 -- 15, and 17.
%
% (6) Hyphen appears both at 45 and 173 for compatibility with both ASCII
% and Windows ANSI.
%
% (7) It doesn't really matter where ligatures appear (both real, such as ffi,█
% and pseudo such as ---) since these should not be accessed directly, only
% via ligature information in the TFM file.
%
% SAMPLE USAGE (in 'psfonts.map' file for DVIPS):
%
% lbr LucidaBright "TeXnANSIEncoding ReEncodeFont" <texnansi.enc <lbr.pfb
%
% This tells DVIPS that the font called 'lbr' in TeX has PostScript
% FontName 'LucidaBright.'  It also asks DVIPS to expand the file 'lbr.pfb'
% into PFA form, to include the attached 'texnansi.enc' encoding vector,
% and to then actually reencode the font based on that encoding vector.
%
% Revised 1996 June 1 by adding second position for 'fl' to avoid Acrobat bug.█
% Revised 1996 June 1 by adding second position for 'fraction' for same reason.█
% Revised 1997 Oct 1 by adding cwm  (used in boundary char TFM code)
% Revised 1998 Mar 1 by adding Unicode for Euro character

Appendix C Font legalities

This section owes a great deal to Charles Bigelow (co-designer with Kris Holmes of the Lucida typeface family, among others), who has generously answered our many queries about fonts and the law around the world with remarkable patience and understanding. (But he is naturally not responsible for any errors here, much less our opinions.)

Fonts have always been treated rather strangely under the law, as befits their rather strange nature: letterforms are indivisibly both *useful* and *artistic.* In most countries—in all countries until recently—utility has taken precedence; i.e., it has been legal to copy fonts without permission or fee.

In any case, to the best of my knowledge, the situation in those countries which have adopted any sort of typeface protection is as follows. This was originally written in the early 1990's; these days, the situation is probably different, due to widespread adoption of software patents, among other things, but I lack specific information to include.

United States
>
> Typeface designs can be patented, but not copyrighted. Only a few designs have been patented. (Lucida and Stone are the only ones I know of. I don't know what the grounds were for patenting Stone, but Lucida had some novel features in its design which make it reasonable to patent, given the acceptance of the patent system in the first place.)
>
> Particular programs which instantiate a font can be copyrighted just as any other computer program can. This is arguably wrong, since font programs are nothing but a description of the shapes, possibly with some simple hints, and there's only one basic way to describe the shapes in any given language. Thus, the creativity lies in making the shape right, not in making the computer program right, so it would seem that to be consistent, the copyright laws should protect the design, not the program—the opposite of the current situation.

Germany
>
> Typeface designs have been copyrightable as original works of art since 1981. As a result, many (perhaps most) designs have been copyrighted there. The law is not retroactive, but German courts have upheld the intellectual property rights of designers of earlier fonts as well: In one case the heirs of Paul Renner (designer of Futura) won a suit against the Bauer foundry for arbitrarily discontinuing a portion of their royalties.

England
>
> A copyright law passed in 1989 covers typeface designs first published in England (or published in Britain within 30 days of its publication elsewhere), and it *is* retroactive. It's unclear how far back the law extends, but Times Roman, designed in the late 1920's and 1930's by Stanley Morison is probably covered. This does not mean GNU (for example) cannot have a Times Roman; it just means we cannot start with an English version, as the law does not forbid importing foreign versions of English typefaces.

France
>
> The Romain du Roi typeface designed by Philippe Grandjean in 1702 for the French royal family is protected, and perhaps other such "royal" designs. There is no protection for designs in general.

In 1973 the international Vienna treaty on typeface design protection was proposed. France ratified it in 1974 or 1975, and Germany in 1981. The English law might constitute ratification, but this has not been settled. In any case, since at least four countries have to ratify it before it takes effect (and even then it takes effect only in those countries which ratify it), it is still of no consequence for now.
